

Affixed to the reverse of the sign, our sign rail / channel section is used on post mounted signs to allow the use of fixings such as sign clips and/or banding with the use of universal channel clamps.

Typically constructed from aluminium alloy, the sign channels are secured to the reverse of the sign using Böllhoff rivets or structural bonding tape which conforms to BS EN 12899-1:2007.

Our sign channel is supplied in 3 standard sizes of small, medium, and large. Depending on the size of sign ordered, this will determine the sign channel size used, for example a 300mm diameter Circular sign will use the small channel section, whereas a 750mm Triangular sign will use medium channel section.

The sign channels are usually supplied in a Traffic Grey (RAL 7005) finish to match that of the back of the sign plate. Should the reverse of your sign be Traffic Black (RAL 9017) to meet a specification, this can also be accommodated.
